Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CATALYTIC ACTIVITY: 5-METHYL-5,6,7,8-TETRAHYDROMETHANOPTERIN +
2-MERCAPTOETHANESULFONATE = 5,6,7,8-TETRAHYDROMETHANOPTERIN +
2-(METHYLTHO)ETHANESULFONATE
SUBUNIT: COMPOSED OF 8 DIFFERENT SUBUNITS (BY SIMILARITY).
SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).

"The structure of an insect parvovirus (Galleria mellonella densovirus) at 3.7 A resolution.";
Structure 6:1355-1367(1998).

-! SUBUNIT: THE VIRUS CAPEID IS COMPOSED OF 60 ICOSAHEDRAL UNITS, OF A COMBINATION OF VP4, VP3, VP2 AND VP1.

-! ALTERNATIVE PRODUCTS: THE FOUR DIFFERENT COAT PROTEINS ARE PRODUCED BY ALTERNATIVE INITIATION.

       FUNCTION: NOR COMPLEX CATALYZES THE REDUCTION OF UBIQUINONE-1 TO UBIQUINOL BY TWO SUCCESSIVE REACTIONS, COUPLED WITH THE TRANSPORT OF NA(+) IONS FROM THE CYTOPLASM TO THE PERIPLEASM. THE FIRST STEP IS CAPALYZED BY NORF, WHICH ACCEPTS ELECTRONS FROM NADH AND PATHWAY (EN SIMILARITY).

CATALYZED CATIVITY: NAHICH HUBIQUINONE BY A ONE-ELECTRON TRANSFER CATALYZIC ACTIVITY: NAH + UBIQUINONE + NA(+)(IN) = NAD(+) + UBIQUINONE + NA(+)(IN) = NAD(+) + COPPCTOR FAD AND A 2FE-2S CLUSTER (BY SIMILARITY).

SUBUNIT: COMPOSED OF SIX SUBUNITS; NQRA, NQRB, NQRC, NQRD, NQRE

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                          pneumoniae,
                                                                                                        The present sequence is a fusion protein comprising a truncated Chlamydia pneumoniae 76 kDa protein and vector-encoded residues. C. pneumoniae 76 kDa protein is used in the diagnosis, prevention and treatment of C. pneumoniae infections (e.g. pneumonia, upper respiratory tract disease, bronchitis, sinusitis and acute respiratory disease such as cough, sore throat, hoarseness, fever; and abnormal cheat sounds on auscultation). C. pneumoniae sequence is also used as vaccines for immunising humans against diseases
                                                                                                                                                                                                                                                                      ;

AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinualitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584435879) can be used in immunogenic compositions as vaccines. Vectors containing C pneumoniae nucleotides sequences can also be used as immunogenic compositions.

```

kDa

pneumoniae 76

```
a 76 kDa protein from Chlamydia pneumoniae, against Chlamydia infections -
                                                                                                                                                                                                       protein is used in the diagnosis, prevention and treatment of C. pneumoniae infections (e.g. pneumonia, upper respiratory tract disease, bronchitis, sinusitis and acute respiratory disease such as cough, sore throat, hoarseness, fever; and abnormal chest sounds on auscultation). C. pneumoniae sequence is also used as vaccines for immunising humans against diseases
                                                                                                                                                                   The present sequence is 5'-truncated Chlamydia pneumoniae 76 kDa protein. C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13;
                                                                                                                                                                                                                                                                                                                                                                                                               AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAX01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genttal diseases such as perihepatitis, bartholinitis; penimpatitis, sentendial paratrachoma, and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 116 ksglenaktlaeyetkmadlmaalgdmeansdpsndhteelnnikkaleagkdti---- 170

The present invention relates to new nücleic acid sequences and the proteins encoded by the nucleic acid sequences. The encoded proteins comprise an immunogenic portion of a chlamydia antigen. The encoded proteins are useful for the serodiagnosis and treatment of Chlamydia infection. Chlamdiae are intracellular bacterial pathogens that are responsible for a wide variety of human infections. C. trachomatis infection is one of the most common sexually transmitted diseases and can bead to pelvic inflammatory disease (PID), resulting in tubal obstruction and infertility. Trachoma due to ocular infection with C. trachomatis is the leading cause of preventable blindness worldwide. C. pneumonia is a major cause of acute respiratory tract infections in humans and is also thought to play a role in the pathogenesis of atherosclerosis and concernary heart disease. The present sequence is a protein isolated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated polypeptide for diagnosis and treatment of Chlamydia infection comprises immunogenic portion of Chlamydia antigen, which comprises amino acid sequence encoded by polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    355 -RVSMLLDDAENETASILMSGFRQMIHMFNTENPDSQAAQQELAAQARAAK---AAGDDS 410

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from Streptococcus suis type II (non-pathogenic) which allows the detection and the prevention of infections by S. suis in a more effective manner than was previously possible. It facilitates screening of e.g. pigs and elimination of infected and carrier pigs can then be carried out. The new diagnostic tests can distinguish between avirulent and virulent strains. It may be used in the prodn. of a vaccine. See also AAR27744 and AAR27746.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of the extracellular factor related protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is provided in a specification relating to compounds and methods for the treatment and diagnosis of chlamydial infection. The compounds provided include polypeptides and fusion proteins comprising immunogenic portions of chlamydia antigens and DNA sequences encoding such polypeptides. They are useful for vaccinating against chlamydial infection, which causes pelvic inflammatory disease, trachoma, acute respiratory tract infections, atherosclerosis and heart disease.

of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vecines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases. e.g. e.g. e.g. blaseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, partholialis, penimpeathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antiinflammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be useful as immunogens and/or antigens. The proteins and nucleotides can be useful for the diagnostic assays. The proteins and nucleotides can be useful for the detection and diagnosis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Streptococcal protein, useful as a vaccine, for diagnosis of pneumococcal diseases and for screening agents capable of antagonizing or inhibiting expression of the protein

sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                         Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                255

AAR84565-R84569 are polypeptides of the TCR27 protein of T.cruzi
The proteins are all fusion products with glutathione-Stransferase
(GST) and some contain a linker sequence. The TCR27 protein comprises
a 95 amino acid (aa) N.terminal region; 69 repeats of a highly
conserved 14 as sequence and a 68 as C.terminal region. This sequence
encodes the GST sequence, the Ag44 polypeptide contg. 16 of the 69
repeat units and also contains the amino and carboxy terminal
contentiagnosis of Chagas disease (American Trypansonalisals), they
are capable of detecting anti-T.cruzi antibodies; or for blood
screening. The TCR27 protein has epitopes to which most T.cruzi
infected individuals have antibodies. The TCR27 polypeptides will not
react with serum from patients with leishmaniasis, schistosomiasis,
or autoimmune disease and are hence less likely to cause false

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptococcus mutans antigen I/II (AAW02098) is a 185 kDa cell surface protein at least partly responsible for 5. mutans adhesion to teeth. The I/II antigen includes a series of overlapping T-cell, B-cell and adhesion epitopes. Fragments (see also AAT36111-21) of the I/II antigen gene (see also AAT3612) can be used to produce recombinant polypeptides (AAW02087-97) carrying such epitopes for use in vaccines for immunisation against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                48 KESKIDSVERWSILRSAVNALMSLADKLGIASSN-SSSSTSRSADVDSTTATAPTPPPPT 106
